

CEEFM CASE STUDY

From Digitally Underrepresented to AI-Ready: CEEFM's 16 to 77 GEO Improvement

Client: CEEFM Kft

Industry: Facility management, Budapest

Engagement: Digital growth foundation, March to June 2026

Status: Engagement closed June 2026

The client

CEEFM is a Budapest-based facility-management company founded in 2010. It provides technical maintenance, cleaning, and property-management services for commercial clients across Hungary.

The company had substantial operating experience, but its digital presence did not communicate that experience clearly. Buyers, search engines, and AI-assisted search systems had limited structured evidence from which to understand the business.

The starting point

BridgeWorks' March baseline recorded a GEO and AI-visibility diagnostic score of 16/100, in the Critical band.

The baseline identified a connected set of problems:

- weak website and service-page structure;
- limited machine-readable business information;
- incomplete search discovery signals;
- no clear AI-readable company overview;
- thin entity and authority signals;
- no structured outbound prospecting system.

The diagnostic score was a BridgeWorks planning measure, not a platform ranking or a guarantee of inclusion in any AI answer. Its purpose was to make the infrastructure gaps visible and measurable.

What BridgeWorks built

Website and service structure

BridgeWorks created a bilingual, server-rendered website with clear service and contact routes. The work translated CEEFM's operational experience into pages that buyers and crawlers could navigate and interpret.

Structured business information

The site received machine-readable business markup, including organization/service identity, contact-page information, breadcrumbs, legal details, and consistent entity references. The markup described information visible on the site rather than unsupported claims.

Discovery and crawler foundations

BridgeWorks implemented sitemap and indexing infrastructure, Bing Webmaster verification, IndexNow support, crawler-access controls, and an `llms.txt` overview. The sitemap and robots controls supported page discovery. The `llms.txt` file was used as an experimental, human-readable company index, not presented as a ranking factor.

Entity and trust signals

The work connected CEEFM's website, legal identity, social profiles, and Wikidata record. Incorrect or risky claims were removed, including an unsupported self-declared aggregate rating and a credential the company did not hold.

Content and sales infrastructure

BridgeWorks produced two months of LinkedIn content, visual assets, reporting, an 84-company prospect database, and a five-step outreach sequence. These assets gave CEEFM a practical way to use the new foundation rather than leaving it as a static website project.

Handover

An 86-file, 38.76 MB handover package preserved the source code, reports, content assets, outreach material, and operating instructions. The package was designed so the client or a future supplier could continue without rebuilding the project history.

Verified result

The June 10 engagement-close audit recorded a GEO and AI-visibility diagnostic score of 77/100, in the Good band.

Measure	March baseline	June 10 close audit
BridgeWorks GEO diagnostic	16/100	77/100
Diagnostic band	Critical	Good
Point change		+61
AI-readable company overview	absent	present
Structured business information	weak or absent	implemented
Search discovery controls	incomplete	sitemap, crawler controls, Bing verification, and IndexNow implemented
Prospect database	absent	84 companies

The score movement demonstrates a measurable improvement in the site's technical, structural, entity, content, and platform-readiness signals. It does not prove that CEEFM will appear for every prompt or search query. Visibility still depends on indexing, query relevance, competition, third-party authority, and platform-specific systems outside BridgeWorks' control.

What remained unresolved

The close audit documented remaining limitations rather than hiding them:

- Google Business Profile verification was still pending.
- Four new funnel pages had not yet been added to the sitemap at handover.
- FAQPage markup was not yet present at handover.
- CEEFM still needed stronger named-team and third-party review evidence.

Several technical fixes were applied immediately after the handover audit, producing a separate June 11 internal reading of 78/100. BridgeWorks uses 16 to 77 publicly because 77/100 is the verified engagement-close figure.

Commercial lesson

CEEFM did not primarily need more advertising. It needed a business foundation that could be understood by buyers and machines:

1. clear service pages;
2. accurate, consistent entity information;
3. crawlable and indexable URLs;
4. structured data that matches visible content;
5. citable proof and named expertise;
6. a direct path from visibility to prospecting.

The useful result was not one technical file or one score. It was the connection between website structure, search discovery, authority evidence, reporting, and outbound readiness.

About BridgeWorks

BridgeWorks helps small businesses across Africa and Central Europe become easier for buyers, search engines, and AI-assisted discovery tools to understand. The work combines websites, structured information, technical discovery, content, and practical acquisition systems.
