Audit thesis

The free quote and site visit offer can be strengthened with follow-up automation.

Free preview. Short on purpose.

Full paid audit includes prioritization and implementation detail.

Findings (3)

Finding 1

What I saw

The quote/contact path does not set a clear response-time expectation for new enquiries.

Why it matters

In B2B services, speed-to-lead often beats pricing. Slow or uncertain response reduces win rate and increases churn to competitors.

Severity: High

Finding 2

What I saw

Post-submit reassurance and next steps are likely weak or missing (what happens after someone requests a quote).

Why it matters

If prospects do not know what happens next, they hesitate or submit multiple enquiries elsewhere. It also increases no-shows later.

Severity: High

Finding 3

What I saw

Trust proof is present or implied, but it is not converted into a simple trust path for decision-makers (logos, outcomes, and scope clarity).

Why it matters

Commercial buyers need risk reduction. A sharper trust path increases qualified enquiries and reduces back-and-forth.

Severity: Medium

Likely effect

If response expectations are unclear or slow, you lose deals before pricing is even discussed. Speed-to-lead improvements usually increase win rate and lead quality fast.

Quick win

Add a clear response-time promise on the quote path and ensure every enquiry triggers a confirmation message that sets the next step.

Bigger opportunity

Set up a simple lead routing and follow-up system: instant acknowledgement, internal alert, and a short follow-up sequence for non-responders.

Recommended next step

Recommendation

A speed-to-lead audit and fix sprint: map the enquiry path end-to-end, then implement a response promise, routing, and a basic follow-up sequence.

Suggested call topic

Where leads are being lost between form submit and first reply
